Current Research Objectives

Dr. Ute Albrecht, Assistant Professor, Horticultural Sciences, SWFREC (ualbrecht@ufl.edu) and Dr. Sarah Strauss, Assistant Professor, Soil and Water Sciences, SWFREC (strauss@ufl.edu)

Research topic: Use of plant biostimulants to improve citrus tree health under HLB endemic conditions

Primary Research Objective(s): Determine whether applications of plant biostimulants (beneficial microbes, humic/fulvic acids, seaweed extracts) can improve citrus tree health and productivity

Research Goal: Inducing higher disease and stress tolerance in citrus trees to mitigate negative disease effects in a sustainable fashion

Outcomes to date: No significant positive effects of biostimulants on tree health and productivity were observed in the short-term, but field trials are still in progress to determine long-term effects. At this time, results obtained do not support a recommendation from UF/IFAS for use of these products to improve the health of HLB-affected trees.

Funding source for this objective(s): State Legislative funding for the UF/IFAS Citrus Research Initiative
